

## User Personas

Based on the synthesis from my lab data and interview sessions, I modeled three distinct personas. I avoided looking at them solely as tech "resources", and focused strongly on user friction points.

### Persona 1: The Cautious System Administrator

---

- 1. Name:** Alex Mercer
- 2. Age:** 35
- 3. Occupation:** System Administrator
- 4. Background:** Alex manages critical company servers. They frequently handle technical emergencies on-the-go from a mobile smartphone, under tight time pressure to ensure system uptime.
- 5. Goals and Needs:**  
Wants a fast, convenient one-tap mobile capability to check active health parameters and restart crashed apps seamlessly.
- 6. Pain Points:** Extremely anxious about the "fat-finger" phenomenon—fearful of mistakenly selecting a critical shutdown protocol on a tiny mobile display, destroying the production pipeline.
- 7. Tech Proficiency:**  
Very High
- 8. Preferred Platforms:**  
Mobile Device (for immediate alerts/restarts) and Desktop.
- 9. Quote:** *"I want the convenience of mobile controls, but I am terrified I might accidentally break something."*

## Persona 2: The Security-Focused DevOps Engineer

---

1. **Name:** Sarah Jenkins
2. **Age:** 29
3. **Occupation:** DevOps Engineer
4. **Background:** Sarah strongly prefers data sovereignty and opts to self-host back-end infrastructure over trusting major technology conglomerates. Security is woven into her personal life-style.
5. **Goals and Needs:**  
She seeks an administrative console implementing strict multi-factor checks and isolated user roles for broad accessibility without sacrifices.
6. **Pain Points:** Harboring all systems inside a centralized web panel scares her. If her system has vulnerabilities or one set of credentials gets cracked, her total corporate infrastructure crumbles at once.
7. **Tech Proficiency:**  
Very High
8. **Preferred Platforms:**  
Secure web application interfaces.
9. **Quote:** *"If my control panel gets hacked, my entire network is compromised."*

## Persona 3: The Practical Website Operator

---

1. **Name:** David Chen
2. **Age:** 43
3. **Occupation:** Website Operator
4. **Background:** David deals entirely with end-client conversions and basic front-end administration. He has tools showing deep server analytics, but defaults to simply navigating to the web store like a regular buyer to "check if it is up".
5. **Goals and Needs:**  
A highly simplified and direct way to identify failures through conceptual, easily legible status lights without touching core shell commands.
6. **Pain Points:** Finding advanced metrics totally unreadable. Viewing server load stats or background CPU execution streams does not provide actionable help when dealing with an outage.
7. **Tech Proficiency:**  
Moderate
8. **Preferred Platforms:**  
Desktop Application Interface.
9. **Quote:** *"Ideally I'd like the system's health explained in a simple way. Highly complex system analytics fail to point me quickly to the true cause."*

## Task 2: User Stories

Synthesizing the empathy mapped data yielded three crucial design criteria. Structured according to functional needs, they directly dictate core capabilities:

### US1. (Addressing Cognitive Map Navigation):

***As a Website Operator*, I want to visualize server health instantly utilizing simple standard markers like Red, Yellow, and Green lights, so that I grasp active availability instantly, circumventing any fatigue caused by analyzing system codes.**

### US2. (Addressing Error Prevention Constraints):

***As a System Administrator*, I want to be explicitly prompted to verify a two-step validation request before sending core commands from mobile, so that I experience confidence preventing accidental taps that shut critical sites offline.**

**US3. (Addressing Central Point Constraints):**

*As a DevOps Engineer*, I want to rely upon enforced Multifactor Authentication systems surrounding any panel instance, so that my deployment architectures benefit from central operations strictly devoid of external intrusion fact
